

## OSIS, the Integration Server for the Intra-logistics, - the modern interface between internal and external company logistics -

Intra-logistic is a terminology for the organisation, realisation and optimisation of internal material flows in industrial companies, retail companies, transport management companies and in public organisations by the use of technical systems and services.

The information technology is an important part of the intra-logistics; it increases considerably the quality and economic efficiency of business processes. It plays a major part in the integration of the company's internal and external logistics into a common "Supply Chain Management" of e.g. industry, retail, transport management, banking, public authorities etc.

Here **OSIS** offers a **modern, reliable and cost effective solution**. OSIS integrates e-Business in business processes and networks fragmented IT-Systems, internal in EAI scenarios and between companies via EDI, also using internet based technology. OSIS is from the **SAP AG for Netweaver certified**.

OSIS is based on a **modular concept**, the message exchange and the message translation are carried out in configurable workflows:

- All processing regulations are configured via a **Graphical User Interface**
- **Processing modules** enable the messages to be filtered, split, converted and also enable special processing of the message structure to ensure compatibility with the receiving system
- The **data transfer** is carried out via communication components that support file transfer, SQL-access, process communication or data transfer via the SAP business framework.
- **all processes** in the operating system run automatically under monitored conditions
- OSIS **supports SOA**, the creation of a service orientated architecture.
